What excites you?

The Heat rely on player positioning to create isolation plays for LeBron James and Dwyane Wade, often on the left side. The Heat take many fewer 3-point shots than the Thunder.

LeBron James

Jimarielle Bowie at her alma mater, Angelo Rodriguez High School, in Fairfield, Calif. A lawyer, she credits some of her success to the friendships she made in high school.

Over the last four decades, the financial circumstances into which children have been born have **increasingly determined** where they have ended up as adults. But an **expansive new study**, based on billions of social media connections, has uncovered a powerful

HUMAN DEVELOPMENT INDEX

A Brief Introduction

About the Human Development Index

The **Human Development Index (HDI)** was created to simplify data that provide and that capabilities should be the ultimate criteria for assessing the development of a country, **not economic growth alone**. The HDI can also be used to question national policy choices, asking how two countries with the same level of GDP per capita can end up with different human development outcomes. These contrasts can stimulate debate about government policy priorities.

The HDI is a summary measure of average achievement in key dimensions of human development:

- long and healthy life
- being knowledgeable and
- have a decent standard of living.

The **health dimension** is assessed by life expectancy at birth, using a minimum value of 50 years and maximum value of 85 years. The **education dimension** is measured by mean of years of schooling for adults aged 25 years and expected years of schooling for children of school entering age. The **standard of living dimension** is measured by gross national income per capita. The scores for the three HDI dimension indicators are then aggregated into a composite index using geometric mean.

Human Development Classifications

HDI classifications are based on HDI final cut-off points, which are derived from the quartiles of distributions of component indicators. The cut-off points are HDI of

- less than 0.550 for **low** human development,
- 0.550–0.699 for **medium** human development,
- 0.700–0.799 for **high** human development and
- 0.800 or greater for **very high** human development.
